

A durable, heat-treated chain for industrial use, offering high tensile strength and excellent wear resistance

Mid-link chain, particularly in Grade 80 (G80), represents a "middle ground" in marine and overhead lifting hardware. It is specifically engineered to bridge the gap between the compact nature of short-link chain and the wide openings of long-link or open-link chain.

In the marine industry and for use with compensator buoys, G80 mid-link chain is often chosen when high strength and specific mechanical compatibility are required.
